1) What is a witness and what is media and things you can do with it.

    a. A witness is anything that points to a target. A target is whatever you want to process.

    b. Anything that is unique to the target can be used as a witness. That includes photos, blood or DNA samples, full name with address or other unique identifiers.

    c. Media is anything that can store rates. Generally anything that is crystal, carbon or water can store rates. Some things may not store rates as long as others. Crystals are proven to be reliable in the storage of rates. Tests have shown crystals with stored rates multiple decades old with no deterioration. Clear glass can not hold rates. Clear glass is not a crystal and is not a solid but a liquid with high surface tension. This is why clear glass can be used for well walls. Clear plastic is also used for well walls. I think that is fine for a witness well but not for a potentizer well. Gas may be able to hold rates, but it tends to float away. Industrial uses of potentized gases should be investigated. Example, a torch with unique properties. Some things like clothes can be potentized because cloth is made from carbon. The problem, and it is unknown why, is that the potentization is lost over time. I think it may have something to do with washing and drying. This problem is easy to resolve. Use the media card #147 Self Regenerating Rates along with card #3 Lock Gems (solids). This will maintain the rates in the media.

d. It is possible to make clear plastic that will not hold rates. The process is simple. Clear the plastic then lock it against change. This also works for crystals. Quartz crystals have been used as amplifiers in radionics for decades. To insure they do not build up residue, clear them then lock them. They will no longer be able to hold rates but will still amplify.

e. The ability to ship media with stored rates or in fact, just mail bills is becoming harder. The US Postal Service now is slow and often loses mail. UPS and FedEx are expensive and often lose mail. UPS told me they did not know where Andrew's AFB was. The Post Office said the same address was undeliverable. FedEx was able to deliver but has since started having problems. In the meantime, email and websites are very good ways of distributing stored rates. They way to do this is to make a witness of the media. For example, using a plastic card (carbon) store the rates then take a digital photo of the card. The digital photo can be sent via email or put on a website. At the receiving end, the photo can be used directly via the display of a cell phone or printed out and used. It is still a witness not a media but if the witness was potentized into a media then that would create a new master copy of the media with the same stored rates.

2) Visibility and Compression of pages of rates into one rate.

a. Making rates visible using Excell Line charts. I have only tested this with base-10 rates, but it should work with any. Using a spread sheet, I put one rate into each cell. I then select the insert tab then line chart or whatever way I wish to visualize the rates. The unique property of a line chart

is that it is sequential and can be used directly as a sigil of rates.

b. Compression of pages of rates into one rate using Excell is also possible but requires care. Put a large number of rates into a spreadsheet. For example, each row contains one set of rates. Continue entering collections of rates in rows. After they have been entered use the intrinsic addition function to add each column into a new cell. Then divide that value by the total number of rows. That will bring the number back into fitting within base-10. Do that for every column. The new rate is one line that incorporates all the rows and columns in the spreadsheet. Before using, dowse "Will this new rate work exactly in the same way as all of the rates individually."

3) Experiences using Radionics Commands

a. My first radionics machines were what were then called wish machines. They did not have dials and only had an input plate. You wrote your wish on a piece of paper and put it on the machine with a witness. It became natural once I started using actual full scale radionics machine that I continued the process of writing wishes. At a radionics conference in Rapid City, I heard Daniel Taylor talk about Radionics Commands. It was the old written wish but in a much more clear and defined form and as a command, not a wish. An example of a command is, "the spine straightens without harm".

b. As many of you know from my recent book, "Build a Low-Cost Base-10 Radionics Machine", page 18, I believe in the ITIQM -Information Theoretic Interpretation of Quantum Mechanics. This theory suggests that the universe/existence is fundamentally composed of information and that physical reality is a manifestation of

that information. For a spiritual interpretation of ITIQM look in the same book on page 28. There I state, "In the before time, God noticed it had a though and with that thought God existed. That was the first paradox. Then God thought about things besides itself, and time, energy and spirit existed. With that though God became The Prime Mover. Then God thought about others that could think and with that, Life existed. With that thought God became The Source. All of this is rooted in the first thought which was, "I AM".   If my understanding is correct, then this is why Radionics works. If you think about this theory, it can provide a lot of useful tools that you can use with radionics.

c. This also means that our thoughts and words are very important to the operation of radionics. Words are extremely data rich. Even more so that rates.

d. This also means that if you want to use written commands you need to plan carefully and make a very exact and very precise command of what you want to accomplish. Notice my example about the spine. That command can have no other interpretation. I still took a day to consider was it the best I could make it. The command worked very well on a test animal with a bent spine.

e. I strongly suggest you supplement your rates with written commands.

4) Why you should always use Spooky2 (Rife) via Radionics.
   a. Frequency vs Rates
      i. Frequency is something that exists on the same physical plane as us. It is normally referred to as cycles or Herz which is the unit of measurement of

the speed of the frequency oscillation. Frequency is time based and therefore will always take a specific amount of time to broadcast. In addition, if multiple frequencies are used they are normally produced in serial or small parallel batches. A complex Rife program that uses dozens of frequencies could take weeks to months to complete.

ii. Rates do not exist on the same physical phone as us. They are data items that point to the answer we need somewhere in the vast pool of information that is existence. They do not operate within time or space which is why we are able to do remote broadcasting and why we are able to do minor manipulations of time using Radionics.

iii. One of the problems with using Sequential Frequencies is that you are never sure which frequency is the one that is needed to resolve the problem. You only know that it is in the program of selected frequencies. This can take a long time.

iv. Frequencies, rife or music, can be put into the audio input port of a radionics machine and then stored on media. Since Rates are not time based the information of the collection of frequencies is broadcast all at the same time. This means that you don't have to wait for the correct frequency to come up in the sequence. I call this process compression of frequency into stored rates.

v. There are many different things that are frequency based that can be stored radionically. Prayers, music such as chanting or favorite songs can be compressed. Never under estimate the power of music to heal.

5) Making smart radionics programs using IF
    a. Hemopathies that self-select

6) New to Old (Past to Present)
    a. Using younger witnesses to help older witnesses of same person
    b. Create rates to filter out negative transfer

7) Audio to Radionics
    a. Music – Is extremely data rich and emotionally rich.
    b. Prayer – Once in audio form can be potentized into media.

8) Emotional Radionics
    a. Emotions are often a cause of illness
    b. Correction of emotions are often the critical point in healing
    c. Even when emotions are not the primary issue, correction can accelerate the results of balancing.

9) Virtual Radionics
    a. How to balance different witnesses with different rates on the same machine without crosstalk.

10) Visualization as Data Rich Information
